Postman Application

What is Postman?

Postman is a popular API testing tool used by developers and testers.

It helps to send HTTP requests to servers and analyze the responses.

It supports API development, testing, documentation, and collaboration.

Widely used for REST API testing.

Why Do We Need Postman?

To test APIs without writing complex code.

To send requests like GET, POST, PUT, DELETE easily.

To check server responses such as JSON or XML.

To automate API testing and save request collections.

Key Features of Postman

User-friendly interface for API testing.

Supports multiple HTTP methods.

Environment variables for testing different servers.

Automated testing with scripts.

Collaboration through shared collections.

HTTP Methods in Postman

GET – Retrieve data from a server.

POST – Send data to create a new resource.

PUT – Update an existing resource.

DELETE – Remove a resource from the server.

PATCH – Partially update a resource.

GET Request Example

Method: GET

URL: https://api.example.com/users

Click 'Send' to retrieve user data

Response: JSON data returned from the server

Method: POST

URL: https://api.example.com/users

Body: JSON data with new user information

Response: Server confirms new resource creation

Method: PUT

URL: https://api.example.com/users/1

Body: Updated user data

Response: Updated resource confirmation

Method: DELETE

URL: https://api.example.com/users/1

Click Send to delete the resource

Response: Confirmation message

Conclusion

Postman is an essential tool for API development and testing.

It simplifies sending requests and analyzing responses.

Supports different HTTP methods like GET, POST, PUT, DELETE.

Widely used by developers and QA testers in software projects.
